Circuit Diagram X Schematic Diagram Diagrams are also called pict³rich diagrams. They are not the same as schematics. Circuit types 1. Closed and open circuit A closed circuit A closed circuit with a complete path, while an open circuit has an incomplete path, that is, not closed. In other words, when you don't turn off the lights in your room, the circuit is incomplete. Therefore, the lamp did not give light. But when you don't turn them on, there's the complete connection of the circuit, from the lights of the lamp. Image Source: completeLectrical.Biz 2. SÃ© rie and parallel circuit in a sÃ© rie circuit, the connection of the components produces the same current flow through all parts of the circuit. The current follows only one path, so in the case of lamps, when a fault or a damaged, the current will not flow through the rest, and no connection. In a parallel circuit, the entities are organized in a way that the current needs to break before the ³ connection. Current dives, therefore, components are charged independently. This type of connection is used in houses for a lamp to be burned. This does not affect all the lighting of the apartment. Image Source: completeLectrical.Biz 3. Short-circuit short-circuit allows current to travel along the unwanted path. The current is obliged to incur minimum resistance; Therefore, the component that is ignored by the short circuit can be damaged. The enormous current flow during a short circuit causes the wires to overheat and can lead to an incNdium. Thus, the need to install circuit breakers and fuse boxes to cut circuits. Image Source: completeLectrical.Biz Main parts of an A circuit, regardless of its size or where it is located, have four significant parts. This includes a power source, popularly known as AC or DC, a conductor that's not the wire, a load it's not the device and a controller (switch). Let's look at in detail: 1. The power source provides the item and current to feed a gadget connected to the circuit. You Have sources sources include batteries of any sort, like those used in cars, laptops, solar panels, etc. They ensure a constant level of voltage to the circuit. A current power source is ideal for providing a maintained current of energy despite the voltage capacity. Current, measured in amps, gets included in a system to protect the device that provides the electrical load on the circuit. For instance, an LED needs a maintained level of current to prevent it from blowing up or getting damaged. 2. The Conductor The Conductor provides the path of the circuit through which energy flows. It is responsible for joining all the other entities of the channel. Just like fluids flow through pipes, the amount of energy need in a circuit determines the measure of the wire that makes up the circuit conductor. 3. The Switch Like any other switch out there, this one also closes (continues) or opens (breaks) the flow of electricity in a circuit. There are various switches like wall switches, key toggles on car keys, pushbuttons, and such biometric tools. 4. The Load It refers to the amount of energy a device requires to complete a task, be it lighting, heating, or starting a process. The amount of power used up gets measured in watts and gets calculated by multiplying the current in amps and the volts in the particular circuit. Nowadays, pretty much every home has a power-consuming item, be it televisions, motors, etc., all these are load devices. Circuit Diagram Symbols The symbols used to make circuit diagrams are standardized on an international level. Every symbol represents a feature of the physical modeling of the device. Hence it is crucial to get what every symbol stands for properly. Next, is a list of the most frequently utilized circuit diagram symbols: The Cell ¢ÃÂÂ it is the energy source. Its logo is two lines, one long the other short, parallel to each other. The Battery ¢ÃÂÂis more than a single cell with the more significant terminal, usually on the left, being + (positive). It Like a series of long and short parallel lines. The wire – is a medium for carrying current from one point to another and connects the components of a circuit. The resistor-regulates the current flow and is usually a zig-zag line. The switch – is responsible for the complete flow of current. It is the break in a straight line or the upward diagonal line in a circuit diagram. The ammeter – is to measure the current represented by the letter A in a circle. The voltmeter – is for measuring the voltage and is a circular letter V V on a circuit diagram. The engine – is a transducer for converting electrical energy into kinetic energy. Its symbol is an M. circling the lamp – it is the component that alters the electric energy to the light. Examples of Circuit Diagrams Next, we will examine examples of circuit diagrams to improve your understanding of them. 1. Energy meter is also known as engine meter. The total power used over a given period is energy and measured by an engine meter. In addition, the engine meters are also used on home power lines to measure the amount of energy used in the DC and AC circuits. Power meters are usually calibrated in kilowatt hours, where one kilowatt hour is equal to the amount of electricity needed to provide 1000 watts of power for an hour. In a motor meter, there is an aluminum disc that rotates non-stop during power consumption. There are also pressure and current coils so that when the voltage is placed on the pressure coil, the current flows through it and produces flow, which releases the touch on the disc. This torque acts on the unit, causing the aluminium disc to rotate. The rotation is proportional to the amount of energy used. It is then recorded on the energy meter. 2. Multi-meter circuit is a black box consisting of electric circuits that allow you to restart almost any form of wiring or electric gadget. It is also known a Volt-OHM and A© VOM meter composed of a multitude of numbers, dials and switches that can be selcitrA selcitrA detaleR .cte ,FDP ,eciffO tfosorciM ekil stamrof fo yteirav a ot margaid tiucric eht erahs nac uoY .snoitpo tropxE rof dneS & tr opxE tceles neht uneM eliF ot og :tropxE ro .snoitpo tnirp rof tnirP no pat dna unem eliF eht ot og :tnirP :neht nac uoY .ti no kcilc-elbuod uoy nehw epahs ot atad dda ,yllaniF :4 petS .stnenopmoc detceles eht gnitcennoc rof seriw dda ,txeN :3 petS .savnac gniward eht otno meht pord dna yrarbil edam-erp eht morf slobmys tnenopmoc etairporppa eht gard ,yldnoceS :2 petS .etalpmeT cigoL dna stiucriC no kcilc elbuod dna gnireenignE neht weN no pat ,unem eliF eht nO :1 petS :margaid tiucric a ward ot spets elpmis eseht wollof ,woN .egap gniward eht ot teg dna wodniw niam eht no yrogetaC gnireenignE morf etalpmet eht kcilc elbuod si od ot evah uoy llA .smargaid lacinhcet ralimis dna ,stiucric cigol ,stiucric cinortcele ,slobmys margaid lacirtcele ni-tliub htiw uoy sedivorp loot ehT .wardE ni dedivorp etalpmeT cigoL dna stiucriC eht ta kool esolc a ekaT :ot deen tsrif uoy ,trap gnillirht eht ot gnipmuj erofeB ./enilno/moc.xamwarde.www//:sptth morf ylisae ti ssecca nac uoY .loot enilno xaMwardE gnisu eno etaerc ot teg ew ,margaid tiucric a fo trap laciteroeht eht ta gnikool retfa ,yllaniF wardE htiw margaid tiucric a etaerc ot woH .yticirtcele gnirusaem rof noitcelloc xobloot ruoy ni evah ot loot tnellecxe na si tI .lennahc eht ssorca MOV eht fo sdne eht gninioj yb ,tiucric eht ssorca egatlov eht ,.e.i ,wolf tnerruc eht erusaem nac uoY .rotsiser a ot elyts seires a ni detcennoc retemonavlag a sesirpmoc retem mho-tlov A .lanoitcnuf llits era secived suoirav ni desu seirettab rehtehw kcehc ot tfiws si tI .gnisufnoc
